Triggering a Pipeline Manually

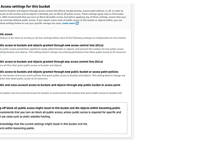
one: we did previously when we triggered our pipeline using an S3 bucket.

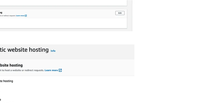
This time we will trigger the pipeline manually and we will do it cross-regionally in a entirely different region, this time we choose Asia Pacific.

There might be a specific use case where you might want to trigger a pipeline in an entirely different region. Lets see how that works.

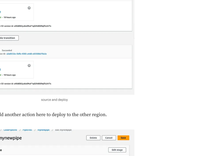
Many of the same steps will apply.

1. Create a new bucket, this time we chose Asia Pacific (Seoul)
2. Remember to enable ACLs so pipeline has access to the S3 buckets.
3. Uncheck block all access so the endpoint is visible to the public.
4. Edit your for static website hosting.





5) Now we go back to our pipeline we had created earlier and click "edit"



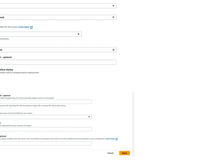
source and deploy

6) We can add another action here to deploy to the other region.

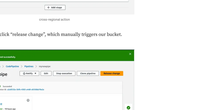
edit action

7) we define the new action name "deploytoseoul", choose the action provider Amazon S3, and we choose the region in which our new s3 bucket lies in which is Asia Pacific. Select sourceartifact and the bucket is named "my-new-seoul".

8) remember to click extract file before deploy and make sure to select public-read under Canned ACL

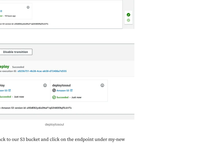


9) Notice the **cross-regional action** deployment under our new stage.



cross-regional action

10) Now we click "release change", which manually triggers our bucket.



deploytoseoul

11) We go back to our S3 bucket and click on the endpoint under *my-new-seoul*.

12) Our website now resides in a new region!
